

Secure your PC

1. Make sure your Windows account is secured with a strong password. This way, KeyLock's security can't be bypassed.
2. Never change KeyLock's keys, unless you know what you're doing.
3. Keep your unlock device in a safe spot where you remember where it is.
4. Always install KeyLock security updates.
5. For the best security: encrypt your hard drive with, for example, BitLocker.
